Giulia Caitlynn G. Hamoy
9 - Potassium

**Activity 5:**

1. What do all the methods (move(), special_move(), use()) in the previous activities have in common?

- They have the same purpose of performing an action, but each class gives them different behaviors.

2. How does this activity show polymorphism in a gaming context?

- It shows polymorphism because different characters and items can use the same method name but perform different actions.

3. Can you think of other examples where the same action behaves differently depending on the character or item?

- A character's attack() method can perform a sword strike, magic attack, or arrow shot depending on the character.
